CS7GV2: Mathematics of Light and Sound, M.Sc. in Computer Science.

Lecture#8: Intensity sums

Fergal Shevlin, Ph.D.

School of Computer Science and Statistics, Trinity College Dublin

November 10, 2022

The means of random intensities I_X and I_Y are,

$$\overline{I_X} = \mathbf{E}[I_X]$$
 and $\overline{I_Y} = \mathbf{E}[I_Y]$.

Linearity of expectation allows the mean of their sum to be expressed as,

$$\mathbf{E}[I_X + I_Y] = \mathbf{E}[I_X] + \mathbf{E}[I_Y]$$

$$\overline{I_Z} = \overline{I_X + I_Y} = \overline{I_X} + \overline{I_Y}.$$

When
$$I_X$$
 and I_Y are independent,

$$\mathbf{E}[I_X I_Y] = \mathbf{E}[I_X] \mathbf{E}[I_Y]$$
$$\overline{I_X I_Y} = \overline{I_X} \overline{I_Y}.$$

Hence,

$$\overline{I_Z^2} = \overline{(I_X + I_Y)^2}
= \overline{I_X^2 + 2 I_X I_Y + I_Y^2}
= \overline{I_X^2} + 2 \overline{I_X} \overline{I_Y} + \overline{I_Y^2},$$

By integration of exponential PDF,

$$\overline{I_X^2} = 2\overline{I_X}^2$$
 and $\overline{I_Y^2} = 2\overline{I_Y}^2$.

So the variance can be expressed as,

$$\sigma_{Z}^{2} = \mathbf{E}[I_{Z}^{2}] - \mathbf{E}[I_{Z}]^{2} = \overline{I_{Z}^{2}} - \overline{I_{Z}}^{2}$$

$$= 2\overline{I_{X}}^{2} + 2\overline{I_{X}}\overline{I_{Y}} + 2\overline{I_{Y}}^{2}$$

$$- \overline{I_{X}}^{2} - 2\overline{I_{X}}\overline{I_{Y}} - \overline{I_{Y}}^{2}$$

$$= \overline{I_{X}}^{2} + \overline{I_{Y}}^{2}.$$

$$C = \frac{\sigma_Z}{\overline{I_Z}} = \frac{\sqrt{\overline{I_X}^2 + \overline{I_Y}^2}}{\overline{I_X} + \overline{I_Y}} = \frac{\sqrt{1 + r^2}}{1 + r}$$
 where $r = \overline{I_Y}/\overline{I_X}$ is the ratio of one mean to the other. Note,

When r=1 the contrast is minimized,

$$C = \sqrt{2}/2 = \frac{2}{2}\sqrt{2} = \frac{1}{\sqrt{2}}$$
.

 $\frac{\sqrt{a^2+b^2}}{\sqrt{a^2}} = \sqrt{\frac{a^2}{a^2} + \frac{b^2}{a^2}} = \sqrt{1 + \left(\frac{b}{a}\right)^2}.$

The means of random intensities I_X and I_Y are, $\overline{I_X} = \mathbf{E}[I_X]$ and $\overline{I_Y} = \mathbf{E}[I_Y]$.

Linearity of expectation allows the mean of their sum to be expressed as,

$$\mathbf{E}[I_X + I_Y] = \mathbf{E}[I_X] + \mathbf{E}[I_Y]$$

$$\overline{I_Z} = \overline{I_X + I_Y} = \overline{I_X} + \overline{I_Y}.$$

When I_X and I_Y are independent,

$$\mathbf{E}[I_X I_Y] = \mathbf{E}[I_X] \mathbf{E}[I_Y]$$
$$\overline{I_X I_Y} = \overline{I_X} \overline{I_Y}.$$

Hence,

$$\overline{I_Z^2} = \overline{(I_X + I_Y)^2}
= \overline{I_X^2 + 2 I_X I_Y + I_Y^2}
= \overline{I_X^2} + 2\overline{I_X} \overline{I_Y} + \overline{I_Y^2},$$

By integration of exponential PDF,

$$\overline{I_X^2} = 2\overline{I_X}^2$$
 and $\overline{I_Y^2} = 2\overline{I_Y}^2$.

So the variance can be expressed as,

$$\sigma_Z^2 = \mathbf{E}[I_Z^2] - \mathbf{E}[I_Z]^2 = \overline{I_Z^2} - \overline{I_Z}^2$$

$$= 2\overline{I_X}^2 + 2\overline{I_X}\overline{I_Y} + 2\overline{I_Y}^2$$

$$- \overline{I_X}^2 - 2\overline{I_X}\overline{I_Y} - \overline{I_Y}^2$$

$$= \overline{I_X}^2 + \overline{I_Y}^2.$$

$$C = \frac{\sigma_Z}{\overline{I_Z}} = \frac{\sqrt{\overline{I_X}^2 + \overline{I_Y}^2}}{\overline{I_X} + \overline{I_Y}} = \frac{\sqrt{1 + r^2}}{1 + r}$$

where $r=\overline{\mathit{I}_{Y}}/\overline{\mathit{I}_{X}}$ is the ratio of one mean to the other. Note,

$$\frac{\sqrt{a^2+b^2}}{\sqrt{a^2}} = \sqrt{\frac{a^2}{a^2} + \frac{b^2}{a^2}} = \sqrt{1 + \left(\frac{b}{a}\right)^2}.$$

When r = 1 the contrast is minimized,

$$C = \sqrt{2}/2 = \frac{2}{2}\sqrt{2} = \frac{1}{\sqrt{2}}$$
.

For a sum of random intensities $I_Z = I_1 + I_2 + \dots I_N$, the mean $\overline{I_Z} = \sum_{n=1}^N \overline{I_n}$ by LOE. $\overline{I_Z^2} = \sum_{n=1}^N \sum_{m=1}^N \overline{I_n I_m}$ $= \sum_{n=1}^N \overline{I_n^2} + \sum_{n=1}^N \sum_{\substack{m=1, \\ m \neq n}}^N \overline{I_n} \overline{I_m}$

Note that
$$(a + b + c)^2$$

$$= (a + b + c)(a + b + c)$$

$$= a^2 + b^2 + c^2$$

$$+ 2(ab + ac + bc)$$

$$= \sum_{\substack{n = \\ \{a,b,c\}}} n^2 + \sum_{\substack{n = \\ \{a,b,c\}\\ m \neq n}} \sum_{\substack{m = \\ a,b,c\}}} nm.$$

Using
$$\overline{I_n^2} = 2\overline{I_n}^2$$
,
$$\overline{I_Z^2} = 2\sum_{n=1}^N \overline{I_n}^2 + \sum_{n=1}^N \sum_{\substack{m=1, \\ m \neq n}}^N \overline{I_n} \overline{I_m}$$

$$= \sum_{n=1}^N \overline{I_n}^2 + \left(\sum_{n=1}^N \overline{I_n}\right)^2$$

$$= \sum_{n=1}^N \overline{I_n}^2 + \overline{I_Z}^2.$$

$$\sigma_Z^2 = \overline{I_Z^2} - \overline{I_Z}^2 = \sum_{n=1}^N \overline{I_n}^2$$

$$C = \frac{\sigma_Z}{\overline{I_Z}} = \frac{\sqrt{\sum_{n=1}^N \overline{I_n}^2}}{\sum_{n=1}^N \overline{I_n}}$$

When mean intensities $\overline{I_n}$ are equal,

$$C = \frac{\sqrt{N\overline{I}^2}}{N\overline{I}} = \frac{\sqrt{N}\sqrt{\overline{I}^2}}{N\overline{I}} = \frac{\sqrt{N}}{N} = \frac{1}{\sqrt{N}}.$$

For a sum of random intensities $I_Z = I_1 + I_2 + \dots I_N$, the mean $\overline{I_Z} = \sum_{n=1}^{N} I_n$ by LOE.

$$\overline{I_Z^2} = \sum_{n=1}^{N} \sum_{m=1}^{N} \overline{I_n I_m}
= \sum_{n=1}^{N} \overline{I_n^2} + \sum_{n=1}^{N} \sum_{m=1, n=1}^{N} \overline{I_n} \overline{I_m}$$

Note that
$$(a + b + c)^2$$

$$= (a + b + c)(a + b + c)$$

$$= a^2 + b^2 + c^2$$

$$+ 2(ab + ac + bc)$$

$$= \sum_{\substack{n = \\ a,b,c}} n^2 + \sum_{\substack{n = \\ a,b,c}} \sum_{\substack{m = \\ a,b,c}, \\ m \neq n} nm.$$

Using
$$\overline{I_n^2} = 2\overline{I_n}^2$$
,
 $\overline{I_Z^2} = 2\sum_{n=1}^N \overline{I_n}^2 + \sum_{n=1}^N \sum_{\substack{m=1, \\ m \neq n}}^N \overline{I_n} \overline{I_m}$

$$= \sum_{n=1}^N \overline{I_n}^2 + \left(\sum_{n=1}^N \overline{I_n}\right)^2$$

$$= \sum_{n=1}^N \overline{I_n}^2 + \overline{I_Z}^2.$$

$$\sigma_Z^2 = \overline{I_Z^2} - \overline{I_Z}^2 = \sum_{n=1}^N \overline{I_n}^2$$

$$C = \frac{\sigma_Z}{\overline{I_Z}} = \frac{\sqrt{\sum_{n=1}^N \overline{I_n}^2}}{\sum_{n=1}^N \overline{I_n}}$$

When mean intensities $\overline{I_n}$ are equal,

$$C = \frac{\sqrt{N\overline{I}^2}}{N\overline{I}} = \frac{\sqrt{N}\sqrt{\overline{I}^2}}{N\overline{I}} = \frac{\sqrt{N}}{N} = \frac{1}{\sqrt{N}}.$$

For random intensities I_X and I_Y decribed as exponential PDFs,

$$f_{I_X}(i_X) = \frac{1}{\overline{I_X}} \exp\left\{\frac{-i_X}{\overline{I_X}}\right\}$$
 $f_{I_Y}(i_Y) = \frac{1}{\overline{I_Y}} \exp\left\{\frac{-i_Y}{\overline{I_Y}}\right\},$

their sum $I_Z = I_X + I_Y$ is described by another PDF, $f_{I_Z}(i_Z)$.

For discrete random quantities $X,Y,Z\in\mathbb{N}_0$, let Z=X+Y. A sum of 3 could result from 0+3 or 1+2 or 2+1 or 3+0 so,

$$P(Z = 3) = P(X = 0) P(Y = 3)$$

 $+ P(X = 1) P(Y = 2)$
 $+ P(X = 2) P(Y = 1)$
 $+ P(X = 3) P(Y = 0)$

$$= \sum_{x=0}^{3} P(X=x) P(Y=3-x).$$

Letting $p_Z(z)$ etc. be discrete equivalents of a PDF to denote probabilities.

$$p_Z(z) = \sum_{x=0}^z p_X(x) p_Y(z-x).$$

Such a sum (or integral) of products of functions is called a *convolution*.

For *continuous* random quantities $X,Y,Z\in\mathbb{R}_{\geq 0}$, let Z=X+Y. The PDF for Z has an integral instead of a sum,

$$f_Z(z) = \int_0^z f_X(x) f_Y(z-x) dx.$$

For random intensities I_X and I_Y decribed as exponential PDFs,

$$f_{I_X}(i_X) = \frac{1}{\overline{I_X}} \exp\left\{\frac{-i_X}{\overline{I_X}}\right\}$$

$$f_{I_Y}(i_Y) = \frac{1}{\overline{I_Y}} \exp\left\{\frac{-i_Y}{\overline{I_Y}}\right\},$$

their sum $I_Z = I_X + I_Y$ is described by another PDF, $f_{I_Z}(i_Z)$.

For discrete random quantities $X,Y,Z\in\mathbb{N}_0$, let Z=X+Y. A sum of 3 could result from 0+3 or 1+2 or 2+1 or 3+0 so,

$$P(Z = 3) = P(X = 0) P(Y = 3)$$

 $+ P(X = 1) P(Y = 2)$
 $+ P(X = 2) P(Y = 1)$
 $+ P(X = 3) P(Y = 0)$

$$= \sum_{x=0}^{3} P(X=x) P(Y=3-x).$$

Letting $p_Z(z)$ etc. be discrete equivalents of a PDF to denote probabilities,

$$p_Z(z) = \sum_{x=0}^z p_X(x) p_Y(z-x).$$

Such a sum (or integral) of products of functions is called a *convolution*.

For continuous random quantities $X,Y,Z\in\mathbb{R}_{\geq 0}$, let Z=X+Y. The PDF for Z has an integral instead of a sum,

$$f_Z(z) = \int_0^z f_X(x) f_Y(z-x) dx.$$

Let $f_X(x) = \lambda_X e^{-\lambda_X x}$ and $f_Y(y) = \lambda_Y e^{-\lambda_Y y}$ be exponential PDFs with rate parameters λ_X and λ_Y . The PDF of their sum is,

$$f_Z(z) = \int_0^z \lambda_X e^{-\lambda_X x} \lambda_Y e^{-\lambda_Y (z-x)} dx$$
$$= \lambda_X \lambda_Y e^{-\lambda_Y z} \int_0^z e^{(\lambda_Y - \lambda_X) x} dx.$$

By FTC the definite integral is the difference between the antiderivative evaluated at the limits,

$$\begin{aligned} & \frac{1}{\lambda_{Y} - \lambda_{X}} e^{(\lambda_{Y} - \lambda_{X}) x} \Big|_{0}^{z} \\ &= \frac{1}{\lambda_{Y} - \lambda_{X}} e^{(\lambda_{Y} - \lambda_{X}) z} - \frac{1}{\lambda_{Y} - \lambda_{X}}. \end{aligned}$$

Or
$$\int_0^z 1 dx = z$$
 when $\lambda_X = \lambda_Y$.

$$f_Z(z) = egin{cases} rac{\lambda_X \, \lambda_Y}{\lambda_Y - \lambda_X} (\mathrm{e}^{-\lambda_X \, z} - \mathrm{e}^{-\lambda_Y \, z}) \ & ext{when } \lambda_Y
eq \lambda_X. \end{cases}$$
 when $\lambda = \lambda_X = \lambda_Y.$

 $\lambda = {}^1/\overline{\imath} \; {
m for} \; \overline{I} = \overline{I_X} = \overline{I_Y} \; , \; {
m so \; the \; PDF \; of \; the \; sum \; is \; a \; {
m scaled}^* \; {
m version \; of \; the \; originals},$ $f_{I_Z}(i_Z) = rac{i_Z}{\overline{I}} rac{1}{\overline{I}} \exp \left\{ rac{-i_Z}{\overline{I}}
ight\}.$

Let $f_X(x) = \lambda_X e^{-\lambda_X x}$ and $f_Y(y) = \lambda_Y e^{-\lambda_Y y}$ be exponential PDFs with rate parameters λ_X and λ_Y . The PDF of their sum is,

$$f_Z(z) = \int_0^z \lambda_X e^{-\lambda_X x} \lambda_Y e^{-\lambda_Y (z-x)} dx$$
$$= \lambda_X \lambda_Y e^{-\lambda_Y z} \int_0^z e^{(\lambda_Y - \lambda_X) x} dx.$$

By FTC the definite integral is the difference between the antiderivative evaluated at the limits,

$$\frac{1}{\lambda_{Y} - \lambda_{X}} e^{(\lambda_{Y} - \lambda_{X}) x} \Big|_{0}^{z}$$

$$= \frac{1}{\lambda_{Y} - \lambda_{X}} e^{(\lambda_{Y} - \lambda_{X}) z} - \frac{1}{\lambda_{Y} - \lambda_{X}}.$$

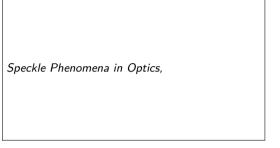

Or $\int_0^z 1 dx = z$ when $\lambda_X = \lambda_Y$.

$$f_Z(z) = \begin{cases} \frac{\lambda_X \, \lambda_Y}{\lambda_Y - \lambda_X} (\mathrm{e}^{-\lambda_X \, z} - \mathrm{e}^{-\lambda_Y \, z}) \\ & \text{when } \lambda_Y \neq \lambda_X. \end{cases}$$
$$z \, \lambda^2 \, \mathrm{e}^{-\lambda \, z} \\ & \text{when } \lambda = \lambda_X = \lambda_Y.$$

 $\lambda=^1/\overline{\iota}$ for $\overline{I}=\overline{I_X}=\overline{I_Y}$, so the PDF of the sum is a scaled version of the originals,

$$f_{I_Z}(i_Z) = \frac{i_Z}{\overline{I}} \frac{1}{\overline{I}} \exp\left\{\frac{-i_Z}{\overline{I}}\right\}.$$
